

THE DATATAG ULTRA HIGH FREQUENCY (UHF) TRANSPONDER FITTING INSTRUCTIONS

A QUICK FIT INSTALLATION GUIDE

Thank you for choosing to enhance your existing Datatag Security System with our new UHF, long read range transponders.

These, the latest addition to the now famous layered approach Datatag uses in all our systems, are the most advanced RFID technology we employ in the fight against organised motorcycle crime. Able to be read from much greater distances than 'normal' RFID transponders they allow police to identify a machine at a distance, quickly and easily and take appropriate action should the need arise.

Registration

The information we hold of your existing Datatag system, contained within our secure database, will be supplemented with the unique details of these two new transponders so you do not have to do anything more.

Installing your new DATATAG UHF Transponders

The two self-adhesive UHF transponders have a strong adhesive layer which, after 24 hours, provides a strong and durable bond if applied to a clean dry flat surface.

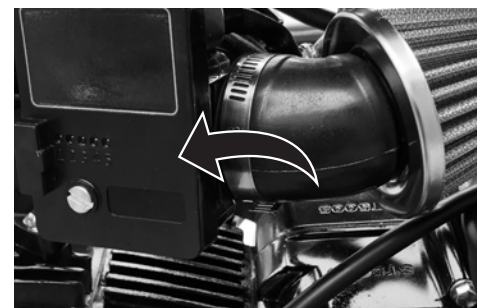

Installation of the transponders:

Ideally both transponders should be placed on a flat or only very slightly curved surface in a hidden area of your motorcycle. Examples of good locations are inside a fairing panel, on the side of the battery box (not battery), on the outside of the air box or inside the tail piece. You should offer up the transponder before taking the backing paper off to ensure that it will fit your chosen location.

Once you have located a suitable area clean it thoroughly with a solvent degreasing agent and make sure it is completely free from dirt, oil or grease before allowing it to dry and only then apply the transponder.

To apply the transponder remove the backing sheet and position it in the chosen location before firmly but gently rubbing the face of the transponder to make sure it is fully adhered to the surface around all the edges.

Repeat this process with the second transponder.
